

# ArcGIS Pro – Exportar a shapefile manteniendo descripciones de dominio y/o de subtipos

Para exportar una capa de Geodatabase a formato shapefile, pero manteniendo las descripciones de dominios y/o subtipos que contenga la tabla, se debe activar la opción “Transfer field domains descriptions” en la sección Environments

The screenshot displays the ArcGIS Pro interface with the 'Export Features' dialog box open. The dialog is divided into 'Parameters' and 'Environments' tabs. The 'Parameters' tab shows the 'Input Features' set to 'Bosque' and the 'Output Feature Class' set to 'Bosque\_exportado.shp'. The 'Environments' tab is active, showing various settings. A red box highlights the 'Environments' tab, and an arrow points to the 'Transfer field domain descriptions' checkbox, which is checked. Other annotations include: 1. A green circle pointing to the 'Bosque' layer in the Contents pane. 2. A green circle pointing to the 'Data' menu. 3. A green circle pointing to the 'Export Features' option in the Data menu. 4. A green circle pointing to the 'Environments' tab in the dialog. 5. A green circle pointing to the 'Transfer field domain descriptions' checkbox. 6. A green circle pointing to the 'OK' button.

1. Clic derecho a la capa a exportar de la GDB

2. Data – Export Features

3. Export Features

4. Ingresar a Environments

5. Activar Transfer field domains descriptions

6. Se ejecuta y como resultado la tabla del shapefile resultante conservará las descripciones de dominios y/o subtipos
